

THE TWO LINES — PREP TO SEALED BAG

Both production lines end to end: prep, capture, and bagging. Raw items only — never bagged, never sleeved, never graded. Each station has its own kiosk showing only its own prompts, and every step is timed.

0 Shared start: tickets from the label printer

Admin prints branded **BAG-...** stickers on stiff card-stock carriers — batch tickets. Every code is registered the moment it prints. A stack of tickets sits at each prep seat.

RAW CARDS · FI-8170 SCANNER
LINE

CARDS

1

Grab an empty bin

Yellow open-front bin (4.5" × 3.6" × 2") — the circulating container. No lids, stacks on the table.

2

A handful of cards in — 50 to 70

Raw cards only, faces the same way. That count fills one 4×6 bag and keeps every scanner run the same size.

RAW COMICS · PANEL PICTURE
LINE

COMICS

1

Grab an empty panel

24" × 24" board, permanent panel number (**P012**), printed and barcoded), six locating corners, matte non-white surface.

2

Six bare comics into the corners

Front covers up, all oriented the same way, seated square in the locating corners. A short final panel is fine — empty slots are detected.

3

Bag sticker into its slot

Unpeeled, in the panel's designated spot — it gets **photographed in the frame**, so the image itself says which

3 One unpeeled bag ticket on top

The ticket rides the bin. It will feed the scanner **first** — the system reads **BAG-...** from the scan itself and opens the batch bound to that bag.

4 Bin onto the incoming table

Stacked in line. The scanner operator always has a next bin — the prepper and the scanner never talk mid-run.

→ NEXT: TICKET + CARDS INTO THE FEEDER

bag these six belong to. The twin sticker is applied to the bag later.

4 Panel onto the incoming stack

45-90 seconds per panel, aiming for 45-60. The camera operator always has a loaded panel waiting — no walking back to prep.

→ NEXT: PANEL INTO POSITION, ONE SHUTTER PRESS

AT THE SCANNER · CAPTURE KIOSK

CAPTURE

5 Ticket first, cards behind it

Feed the bag ticket into the fi-8170, then the 50-70 cards in one run — fronts + backs captured per pass. The ticket's **BAG-...** closes the previous batch and opens a new one **bound to that bag**. The operator just keeps feeding.

6 The system checks — silently

After capture: bag number readable and registered? A front and a back for every card? **Good → straight to AI**. Anything wrong → the batch is **flagged for admin review — the line never stops**, and the scanner never sees it. The physical sticker keeps the physical bag correct either way.

AT THE CAMERA · CAPTURE KIOSK

CAPTURE

5 Panel into the fixed position

Same spot every time — fixed overhead camera, fixed lighting, manual focus and exposure. Nothing to adjust, ever.

6 One shutter press — instant ✓ or X

The frame lands on the controller, which checks **while the panel is still in place**: bag barcode readable? panel ID readable? Green ✓ → move on. Red X → reshoot now, not at bagging. Software reads **BAG-...** + **P012**, crops the six comics, opens the batch bound to that bag.

7 Panel to the outgoing stack

10-15 seconds per panel, camera never waits. AI reads the six covers in the background.

7 Everything back in the bin → outgoing

Ticket on top again, bin to the outgoing table. The capture kiosk resets: "Next bin."

→ BIN WAITS FOR BAGGING

→ PANEL WAITS FOR BAGGING

BAGGING STATION · BAGGING KIOSK

BAG IT

8 Scan the ticket — the check

The system's verdict comes **before any cards move**. Good → continue. Flagged → error tone, confirm **set aside** ✓, next bin. Cards never enter a bag that's going back to the scanner. Three flags in a row → admin alarm.

9 Peel, fill, seal — then scan again

Sticker onto the 4×6 bag, cards in, seal — **scan the bag to say done**. The two scans time the work. No next bin until this one is closed out; the flow is enforced.

→ COLLECTION BOX

BAGGING STATION · BAGGING KIOSK

BAG IT

8 Scan the ticket — the check

Same enforced gate as cards: verdict first. Good → continue; flagged → tone, **set aside** ✓, next panel.

9 In order, peel, seal — then scan again

The six comics come off the panel **in order** into the bag; twin sticker on; seal — **scan to say done** (timed). Sealed bag into the collection box, empty panel back to prep.

→ COLLECTION BOX

Both lines end at the collection box.

Bags pile up there for the **boxing process** (packing session: box scan → bags → dividers) — a separate workflow, run by anyone, any time. Review of AI-flagged items happens in the web app whenever — it never blocks bagging. Every bag's originals auto-archive to Dropbox 📁 under its **BAG-...** number.

One person, one task

The prepper never touches the scanner or camera. The capture operator never preps.

The queue is the buffer

Incoming tables absorb speed differences — capture never idles, prep never rushes.

Identity travels with the work

The bag ticket rides the bin or panel, so the capture carries its own bag number — nothing typed, nothing remembered.
