

CARD SCANNING FLOW

A scanner's day, from sticker sheets to a packed box — touch-first, timed at every step. Putting boxes into storage is a separate process.

This line is for RAW CARDS only.

Not bagged, not sleeved, not graded — bare cards through the scanner, front + back. Comics have their own line: the picture station.

PHASE A · PREPARE ONCE, USE FOR WEEKS

ADMIN

STICKERS

1

Print label sheets — all branded MAX COLLECTION

Bags: 4"×2" **BAG-...** stickers on stiff card-stock carriers — **batch tickets** that feed through the scanner. **Boxes:** jumbo 6"×4" **BOX-...** printed **in pairs**, bars big enough to scan from 4-6 feet on a shelf. **Dividers:** 4"×2" **DIV-...**. Every code is registered the moment it prints.

2

Stick them on

Bags: label across the top of the 4×6 bag. Boxes: **both copies** — one on the base's front face (bottom-left) and its twin on the lid, same corner; if the codes ever disagree, someone swapped lids and the scan just caught it. Dividers: sticker onto the paper divider cards that come with each box.

SHIFT STARTS

PHASE B · THE SCANNING SESSION — TOUCH ONLY, NO MOUSE

SCANNER

SCAN

3

Log in at the station

Touch screen, your own scanner account. Every session is yours — start time, cards, speed.

4

Collection first, then mode

Which collection this session feeds — always the first question. Then the mode: **Single cards** (each card = front + back in one pass). Asked once, never again mid-session.

5

Prepper fills the bins

50-70 raw cards into an open-front bin, one **unpeeled bag ticket on top**, bin onto the incoming table. The prepper never touches the scanner; the scanner never waits for cards.

6

The rhythm — ticket first, then the cards

The ticket IS the batch: the system spots **BAG-...** in the scanned image, closes the previous batch, opens a new one bound to that bag. No screen touches between bins, no barcode gun at the desk.

 EVERY BIN

1. Grab the next bin from incoming
2. Feed the **bag ticket first** — the batch header
3. Feed the cards behind it — fronts + backs captured, count climbs
4. Everything back in the bin → outgoing table

LOAD...**SCAN****END SCANNING**

Unknown or already-used bag code → the line stops with a red banner before a single card files wrong. A batch far under 50-70 cards gets flagged (likely double-feed).

Jam or double-feed? Big banner + sound, one big recovery button. Mouse and keyboard exist as backup only — the flow never needs them.

ANY TIME · LUNCH BREAK, SHIFT END

**Pause — not finish**

End Scanning is two presses (End → Confirm, far apart), then the logout offer. The batch stays open on the server. Coming back: log in → one big button — **"Continue Batch — 163 cards"**

so far." Same collection, same mode, count keeps climbing. Any scanner can continue any open batch.

PHASE C · SECONDS PER BATCH

SCANNER

BAG IT

7

Scan the ticket first — the check

The system's verdict comes before any cards move. **Good → continue. Flagged → error tone, confirm "set aside ✓", next bin** — cards never enter a bag that's going back to the scanner. Three flags in a row raise an admin alarm on the KPI dashboard.

8

Peel, fill, seal — scan again to finish

Sticker onto the 4×6 bag, cards in, seal, **scan the bag = done**. The two scans time the work (bag-and-sticker per bagger). The flow is enforced — no next bin until this one is closed out. Originals auto-archive to Dropbox under **BAG-000123/** ☁; AI review happens any time after — bagging never waits on it.

PHASE D · HOURS OR DAYS LATER — ANY PERSON

SCANNER

BOX IT

9

Packing session — scan a box

Storage → **Start Packing Session** → zap an empty box's **BOX-...** label. The box is the 5-row card house (12.9"×14.2"×4.2"); bags stand on edge in the rows. One open box per person; two packers can run two boxes at once.

10

Bags... then a divider

Zap bag, bag, bag — every beep is a bag counted in. Zap a **DIV-...** divider to close the group and drop the divider card in behind those bags. Repeat row by row.

Flagged bag? Problem tone, bag refused, scanning locks until you tap "**Bag set aside ✓**" — the bag goes to the admin pile, you carry on. You never need to know why.

11 Box Complete

Around 20–30 bags (~3,000 cards), tap **Box Complete**. Lid on — base and lid labels now travel together. Every card is findable: item → bag → box → divider segment.

Mis-scan? 🔄 Undo Last Scan walks it back one scan at a time. Wrong barcode, wrong order, duplicate — flash + buzz, never silent.

This flow ends here.

Boxes onto shelves and into the storage room is a separate process — it never touches scanning.

🕒 EVERYTHING IS TIMED → KPIS

Every handful, session, batch, and box carries timestamps. The Reports page turns them into:

Cards / hour per scanner

Seconds per card

Clean rate (no review)

Rescan rate

Jam rate / 1,000

Backlog by stage

Time-in-stage

Progress vs 300k + projection

Bagged & boxed / week

Value & sales (admin)

Originals are sacred

The captured image is never altered, resized, or deleted by anything automatic.

Every barcode is known

Labels are registered at print time — an unknown scan is always a misread or rogue label.

Dividers mark location only

A divider's number says nothing about the cards behind it.

Removals are admin-only

Cards leave bags only through a documented removal — never silently.
